We should not disable timezone and time/date setting when automatic setting is enabled.

Most of the time you just want to set the date/time in a hurry before the auto system gets a chance to update but don't want to disable the automatic setting.

Now in most platforms you have to disable the auto setting, set the time and then re-enable it, which is a waste of clicks

When the user clicks on "Set Time/Date" we show the Timepicker control as specified in **glacier-controls-spec/ timepicker**

Ntp server address and update frequency
